AGC: 2,000 tonne jacket and topside assembled for Blacktip

West Australian engineering firm Ausclad Group of Companies (AGC) will soon complete in the large fabrication hall the fabrication and assembly of a 2000 tonne jacket structure, topside platform and piles.

The unmanned wellhead platform will service Eni Australia Limited Blacktip natural gas project.

Western Australian engineering firm Ausclad Group of Companies began assembly at the main fabrication hall in November 2007 and this state-of-the-art facility, along with ample laydown area at the CUF, has enabled the project to progress rapidly.

Infrastructure at the CUF will also allow the jacket and topside to be loaded directly onto a heavy lift ship and transported to the southern Bonaparte Basin in the Timor Sea where it will become critical to Eni's operations.

"The CUF has been instrumental in helping AGC to deliver jackets and topsides, and other large modules and subsea structures for some of the world's biggest oil and gas companies and projects," **Joe Macri, Group Business Development Manager, AGC**
