FMC Technologies: Subsea maintenance/aftermarket facility opens for business

FMC Technologies is now providing maintenance and aftermarket support in WA for subsea modules used by the offshore oil industry. FMC Technologies has taken a long-term lease on the CUF's small fabrication hall and the company is looking to eventually build a permanent purpose built subsea maintenance and test facility within the fabrication precinct of the AMC.

The first project undertaken at the new facility was the refurbishment of Woodside's Enfield subsea tool packages. Clients include FMC Technologies and Woodside.
